Suction floating filter

This suction filter is designed to operate a few centimetres beneath the water surface, thus preventing any risk of obstruction caused by the mud lying on the bottom or debris floating on the surface.

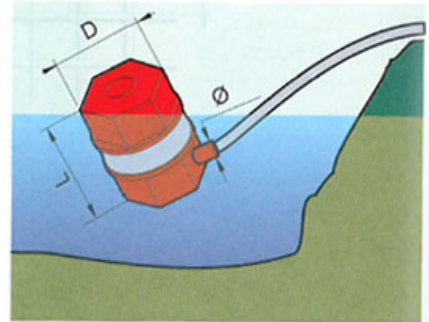

The filter floats thanks to a closed-cell foam ring that prevents it from sinking even in case of accidental breakage. A counterweight ensures adequate balancing so that the suction point is always just beneath the water surface.

The plastic parts are made of top-quality polypropylene while the ample filtering surface is built with stainless steel.

The floating filter is available with five different coupling diameters for the suction pipe.
